

equilibrium between body and its surrounding environment. This is especially the case where the ecology of the environment is abnormal. Consequently, geographic variability has long been an important aspect of health studies in both Eastern and Western cultures. This has been expressed in a variety of approaches ranging from geographic pathology to medical ecology, as well as disciplines such as geographical epidemiology, biometeorology, geomedicine, and so forth. This course aims to introduce students to the concepts and techniques in the discipline of medical geography in general and to examine recent trends in the geographic variation of health.

GEOG 3005 Field Camp (0,*,*) (tbc)

Field camp will be held during the second semester of a student's third year and covers a seven- to nine-day period. Usually it is based in China or Southeast Asia. A wide range of geographical field techniques are utilized in the collection of geographic information and for conducting field research into physical, cultural and developmental problems. While no grades or unit credits are given for this camp, the student must complete the programme to the department's satisfaction for graduation.

GEOG 3006 Regional Geography of China (3,3,0) (tbc)

This is an introductory course on the geography of China. A regional approach is employed to provide students a comprehensive collection of topics over the physical setting, natural resources, population, urban and regional development, industrial and agricultural development, administrative system and geopolitics. These topics span across the time period before and after the country launched its economic reform. This course covers not only topics on social, economic and environmental issues, but also introduces a perspective to understand these activities and their changes.

GEOG 3007 Energy Problems and the Environment (3,3,0) (tbc)

This course introduces students to the causes and effects of the energy problems which have arisen since 1973. The major sources of commercial energy—oil, coal and natural gas—are treated with respect to their special characteristics, exploration and development, major uses, world production pattern, pricing and trade. The special role of electricity, together with problems connected with nuclear power, is covered. Furthermore, the nature and ramifications of the 1973, 1980 and recent oil crises are discussed.

GEOG 3015 Geography of Health and the Environment (3,3,0) (tbc)

Since ancient times, people have worked, lived and multiplied under a wide variety of environmental conditions. According to Chinese medical theory, human health is affected by a lack of equilibrium between body and its surrounding environment. This is especially the case where the ecology of the environment is abnormal. Consequently, geographic variability has long been an important aspect of health studies in both Eastern and Western cultures. This has been expressed in a variety of approaches ranging from geographic pathology to medical ecology, as well as disciplines such as geographical epidemiology, biometeorology, geomedicine, and so forth. The course provides an introduction to the concepts and techniques in the discipline of medical geography and to examine recent trends in the geographic variation of health.

GEOG 3016 Geography of Pacific Asia (3,3,0) (tbc)

The Pacific Asia region covers vast areas of the Russian Far East, East and Southeast Asia, Australia, New Zealand, and many Pacific Island nations. It is very rich in natural resources, history, culture, economy, and political systems. Since the 1970s, the Region has experienced rapid socioeconomic development. With globalization and the emergence of the Chinese economy, in particular, Pacific Asia has become a powerful "engine" for the world development.

GEOG 3017 Global Environment Issues and Sustainability (3,2,1) (tbc)

This course covers environmental problems in the atmosphere, hydrosphere, lithosphere and the biosphere. Sustainability is the over-arching theme of this concept-centred, solution-oriented, and science-based course on contemporary environmental problems. Field and laboratory study form an integral part of the course.

GEOG 3025 Population Geography (3,2,1) (tbc)

This course teaches students with concepts and methodologies to examine population problems and evaluate population policies from a geographical perspective. The course is concerned with conceptualizing and measuring population structure and its dynamics. It explains the way in which populations are distributed through space and over time, together with various factors that generate changes. In particular, the evolving patterns of fertility, mortality and migration are examined from both spatial and temporal perspectives.

GEOG 3026 Techniques in Physical Geography (3,2,1) (tbc)

This course introduces (1) the field and laboratory techniques in geomorphology and biogeography, and (2) the use of meteorological instruments and ways to access and analyse weather maps/images.

GEOG 3027 Urban Geography (3,2,1) (tbc)

We live in an urbanizing world today. It is, thus, imperative to have a basic understanding of this still growing urban phenomenon. The perspective of urban geography emphasizes the production of spatial differences among cities of the world. What is the nature and scope of urban geography? When, where and why did cities arise? How has globalisation affected the growth of cities recently? Why are cities in the Third World growing faster than those in the developed world? Are the socialist cities planned without socio-economic problems? How do we understand urban systems in any country? What are the major socio-economic and spatial features of cities? What are the differences among the developed world, the Third World and the socialist world?

GEOG 3130 Geographical Thought (3,2,1) (E)

This course aims at introducing geography majors to the more philosophical and methodological discussions in the field. Because what geographers do is complex, and the complexity is ever-changing, they tend to have excelled on different aspects of the field and, conversely, ignored its more philosophical and methodological underpinnings. This course is an attempt to redress this imbalance. It surveys the main trends in Western geographic thought over the last hundred years and investigates in detail a few theories of the last thirty years, including the quantitative revolution, humanistic geography, radical geography, locality studies and post-modernism. A brief introduction to the Chinese geographic thought is also provided as a complement. It is hoped that after taking this course, Geography majors would be able to tackle the philosophical and methodological themes in contemporary geographic thought and make sense of their own identity.

GEOG 3580 Honours Project (3,*,*) (E/P/C)

Prerequisite: BSocSc (Hons) in China Studies Year III standing
A required course the purposes of which are to provide actual research experience and an opportunity to undertake a syncretical approach. Students are expected, under the guidance of teaching staff, to conduct a study on aspects of Chinese geography. Identification of a research problem, an understanding of the relevant methodological and theoretical issues, proper use of field and secondary data, adequate citation of the literature, and the writing of a research paper are important ingredients of the research process.

GEOG 3590 Field Camp (0,*,*) (E)

Field camp will be held during the second semester of a student's second year and covers a seven- to nine-day period. Usually it is based in southern China or Southeast Asia. A wide range of

geographical field techniques are utilized in the collection of geographic information and for conducting field research into physical, cultural and developmental problems. While no grades or unit credits are given for this camp, the student must complete the programme to the department's satisfaction for graduation.

GEOG 3591-2 Honours Project (3,*,*) (E)

Prerequisite: GEOG 3590 Field Camp

This is an independent honours project to be taken during the third year of study of BSocSc (Hons) in Geography and normally concerns a particular geographic problem relating to Hong Kong. The project topic is to be selected in consultation with a departmental adviser. Evidence of original research and presentation of professional quality is required.

GEOG 3600 Geographical Information Systems (3,2,2) (E)

Prerequisite: GEOG 1150 Cartography

Geographical Information System (GIS) is an information system that is specially designed for handling spatial (or geographical) data. It combines a set of interrelated sub-systems that create, edit, manipulate, analyse and display data both in text and graphic forms. GIS supports spatial analysis and modelling for the discipline of geography (e.g. location, proximity, and spatial distribution), so that it becomes a vital tool for modern geography. With the rapid progress of computing and Internet technology, GIS technology allows easy and fast access to important geographical information on the region, environment and society.

GEOG 3610 Remote Sensing and Image Interpretation (3,2,2) (E)

Remote sensing is defined as the science and art of acquiring information about material objects without being in touch with them. These measurements are possible with advanced airborne and space-borne remote sensing platforms and sensors that are capable of observing any part of the world frequently with various details. It is discovered that each earth cover has its own spectral reflectance characteristics. The characteristics are so unique that they are called "signature" which enable us to discern the objects from its intermixed background. The final remote sensing process is completed by the analysis of the data using image interpretation and image processing techniques. Some key elements, or cues from the imagery, such as shape, size, pattern, tone or colour, shadow and association, are used to identify a variety of features on earth. The techniques of image interpretation can be further enhanced by the techniques of image processing that can restore, enhance and extract geographical information from original remote sensing images. These altogether yield valuable information on earth resources and living environment of human beings.

GEOG 3620 Advanced Climatology (3,3,0) (tbc)

Prerequisite: GEOG 1200 Earth Systems: Atmosphere and Biosphere or consent of the instructor

An introduction to synoptic climatological methods and applications, with particular emphasis on the climate of China. Climate change and climate modelling are also discussed and provide a comprehensive introduction to applied climatology.

GEOG 3630 Advanced Quantitative Methods in Geography (3,2,1) (E)

Prerequisite: GEOG 1130 Introduction to Quantitative Methods in Geography or consent of the instructor

This course teaches students the application of quantitative methods to geographic problem solving. Statistical methods that are commonly used in geography and regional analysis and spatial analysis methods are introduced. Emphasis is placed on the application of analytical tools to real-world geographic problems and interpretation of analysis results. Topics include regression models, factor analysis, spatial pattern analysis and cluster analysis, etc. The course also provides students with opportunities to learn one of the most widely used statistical software for social sciences—SPSS.

GEOG 3640 Applied Geomorphology (3,2,1) (tbc)

An examination of the applied aspects of geomorphology and development of the student's knowledge and understanding of Earth surface processes and landscape development. Emphasis is placed on the interaction of man and the physical environment using case histories throughout the world, but with emphasis on the Southeast Asia. Attention is given to methods of measurement, monitoring and interpretation of collected data from various spheres. Field study will be required.

GEOG 3650 Geography of Economic Development (3,3,0) (E)

An analysis of the economic problems and prospects of developing countries. A variety of ideological perspectives on the development experiences of developing countries are examined, and assessment is made of the different economic strategies which have been used in attempts to alleviate problems.

GEOG 3660 Political Geography (3,3,0) (E)

An examination of how geographical factors affect political organization at national and international levels. The effects of geographic elements such as territory, population, boundaries, and distance from the sea are covered, followed by a treatment of the capital, the core area of a state, selection of a unitary or federal form of government, emergence of the Third World following the dismemberment of the colonial empires, supra-national organizations, and the complex issues involved in the law of the sea treaty. Moreover, certain major theories in political geography are presented.

GEOG 3670 Geography of Transportation (3,2,1) (E)

This is an introductory course of transportation geography. It first introduces some economical and spatial aspects of transportation geography and various transportation systems. In this connection, the basic concepts of supply chain management and logistics will be introduced. This is followed by the introduction of two important transportation analysis methods: spatial interaction and network analysis. Next, characteristics of urban travel and problems related to urban transportation are discussed. The final module of the course deals with the externalities of transportation activities in the context of sustainable transportation and policies that may mitigate traffic congestion and meet the objective of sustainable development.

GEOG 3680 Coastal Environments and Processes (3,2,1) (E)

Much of the territorial area of Hong Kong and southern China lies below sea level, yet few people are fully aware of how coastal processes operate or what marine resources and problems exist. This course will familiarize students with the processes that dominate local marine settings and introduce them to major coastal environments, especially in the Hong Kong region. It also aims at developing an understanding and awareness of management issues relating to the offshore areas of the territory and the adjacent South China coastline. Offshore and onshore fieldwork form an integral part of this course.

GEOG 3710 Urban Planning (3,2,1) (E)

Prerequisite: GEOG 2180 Urban Geography or consent of the instructor

Theoretical, practical, and methodological issues in policy studies and urban planning are addressed. Urban planning practices in Hong Kong are illustrated. Towards the end of the course, students are expected to conduct independent projects in which they should demonstrate their abilities to (1) identify planning problems, (2) diagnose the cause of such problems, and (3) propose logical strategies to resolve the problems. Fieldwork may be required.
